1. Introduction

The IrqMP is part of the GRLIB device library from Gaisler. It is a multiprocessor capable interrupt controller.

The controller supports among things the routing of interrupts to different processor cores, and also broadcasted interrupts.

2. Configuration

config.nCpu

Number of processors supported.

config.enExtIrq

Enable extended IRQs.

pnnp.config

Plug and play configuration word for APB plug-and-play.

cpu

Up to 16 CPUs supported. IfaceRef property should be connected to the different CPUs.

4. Limitations

The following deviations from real hardware are known to exist with this model:

- Broadcasted interrupts are broadcasted at the current time to all CPUs, if it was triggered by a non-synchronised event, the interrupt is raised at different times on the different cores. Depending on the IRQ frequency and the configured quanta length, this may result in problems.
